

Criterion E: Evaluation

Evaluation of the program and fulfillment of success criteria:

Success Criteria No.	Notes	Fulfilled
1	The user is able to connect to the live streaming server and the stream gets converted into the appropriate format for browser viewing.	Yes.
2	The user is able to watch the live stream (provided one is being broadcasted) by clicking on the video container which loads the stream.	Yes.
3	The user is able to register account provided that the username was not already taken which will alert the user and ask them to pick a different one. If the username was not taken the account gets created immediately and the user is logged in.	Yes.
4	The user is able to log into their account provided that the username and password of the account are correct. If not the user is alerted that the details are incorrect.	Yes.
5	The users when logged in are able to send chat messages to other users provided that a stream is being broadcasted.	Yes.
6	The administrator has the ability to change the stream's title and description after successfully logging into the administration panel, editing the correct labelled fields and pressing the "Set Title & Desc." button.	Yes.
7	The administrator can easily change the CSS layout of the website by accessing the CSS section of the administration panel by pressing the "CSS" button, editing the text box and pressing the "Save" button or the "Reset" button if the administrator wants to revert to default settings.	Yes.
8	The program contains meta tags for the streaming page in the "<head>" section of the index.html.j2 file (Appendix: Code)	Yes.

Recommendations for future improvements

The software has successfully met all of the success criteria set by my client who has provided me with feedback on the software and possible improvements and features which he would like to see be included in the program in future versions.

One of the requested features by my client and features that I also believe should be added is the ability to ban users by account and by IP address. Currently there is no way of punishing users for breaking the rules that the client may set while broadcasting a stream and this may become a problem as my client's channel grows and gains a bigger audience which may attract rule-breakers. This feature could be easily added using an additional database table for storing the punishments, a

simple interface for adding and removing said punishments and simple server logic to handle the request and add or remove data from the database.

Another feature requested by the client was the addition of an ability to reset passwords in case they're lost by the users. This feature would be very useful when the website grows and users may lose their credentials. This feature however would require a slight change to the database structure by including an e-mail field in the account table and the registration process where the password reset link would be sent.

Lastly, another feature which could be potentially added is the ability to save the changes made to the stream title and description into the database. Currently, the stream title and description is stored in program memory, which is volatile, this meaning that when the program shuts down or if the server hosting it loses power, the stream title and description are reset to the default which may prove problematic to the client. A solution to this would involve a special database table which would be able to store various settings which would then be retrieved at the start of the program and updated whenever the administrator wants to change the title or description.
